
TAMARIND

Profile ADEKA Europe GmbH

- **Business Segments:**
 - *Cosmetics, Life Science & Preservatives Boosters*
 - *Lubricant*
 - *Coating & Adhesive*
- **Foundation: 1999**
- **Sales FY 2019 (12 month ending 31st Mar. 2020)**
35 Million Euros, Cosmetics 40%
- **Warehouse in Netherlands & Hamburg**
- **8 Employees**

Powerful stability

□ What is Tamarind

- TAMARIND is a water-soluble, high-molecular-weight polysaccharide called xyloglucan (estimated molecular weight: approximately 470,000), which has a glucose backbone with xylose and galactose side chains.
- Tamarind is a plant-derived polysaccharide.
- It is extracted from Tamarindus Indica seeds.
- Tamarindus Indica tree is distributed in subtropical areas.
- After removing black skins, the seeds are crushed and go through purification process.
- Tamarind has been used as food additive for more than 50 years. Based on this track record of excellent safety, high quality and stable supply, Tamarind recently has been launched in Cosmetics industry
- Tamarind for cosmetics is relatively new, however, it has already been recognized as a natural cosmetic polymer in Japan. The first cosmetic product containing tamarindus indica seed gum was launched in Japan.

Powerful stability

- Main component of Tamarind is xyloglucan.
- Glucan backbone has xylose side chains, which are partially substituted by galactose.
- There are no ionic functional groups in the molecular structure Tamarind has thickening and gelling properties when it is mixed with sugars, dextrin, sugar alcohols, lower alcohols, and polyphenols such as catechin.
- When Tamarind is mixed with sucrose, the viscosity of the mixture will synergistically increase with increasing the concentrations of sucrose.
- When the concentration of sucrose is higher than 40%, the mixture will become a hard, elastic gel without syneresis.

Tamarind is a plant-derived polymer

□ Origin and Manufacturing

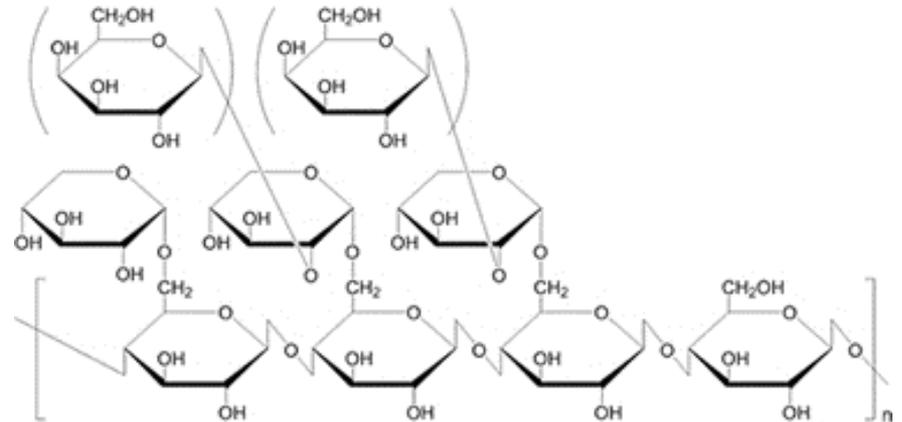

- Natural polysaccharide extracted from *Tamarindus indica* L. seed
- Commercial manufacturing process of tamarindus indica seed gum was established for the first time in the world in 1964.
- Tamarind series are used as food additives as well as cosmetic ingredients.

□ Chemical Structure

- Main component is Xyloglucan

Tamarind seed polysaccharide (TSP) is a xyloglucan of vegetable origin, recently proposed for the cosmetic and pharmaceutical market as a “green” alternative to hyaluronic acid.

Tamarind is a plant-derived polymer

□ Tamarind: a grade which fits to cosmetics

- Highly purified tamarindus indica seed gum. The solution is transparent.
- Dissolves into water without heating.

INCI: TAMARINDUS INDICA SEED GUM

Chinese INCI: TAMARINDUS INDICA SEED GUM

Tamarind is a highly purified tamarindus indica seed gum which fits to cosmetic applications.

- You can get clear solution by only thirty minutes agitation at room temperature.
- INCI name and Chinese INCI

Features of Tamarind

TAMARIND shows moderate viscosity compared to other common natural polymers such as xanthan gum, guar gum, locust bean gum.

Fluidity of TAMARIND solution is unique. It shows Newtonian fluid that viscosity is unchanged as rotation speed increases. like xanthan gum lose viscosity when sheer increases.

- Thanks to this fluidity, Tamarind provides rich texture to cosmetics.
- Also it has no sticky and stringy texture.

TAMARIND is not damaged by heating, pH and salts. It keeps its viscosity under different circumstances.

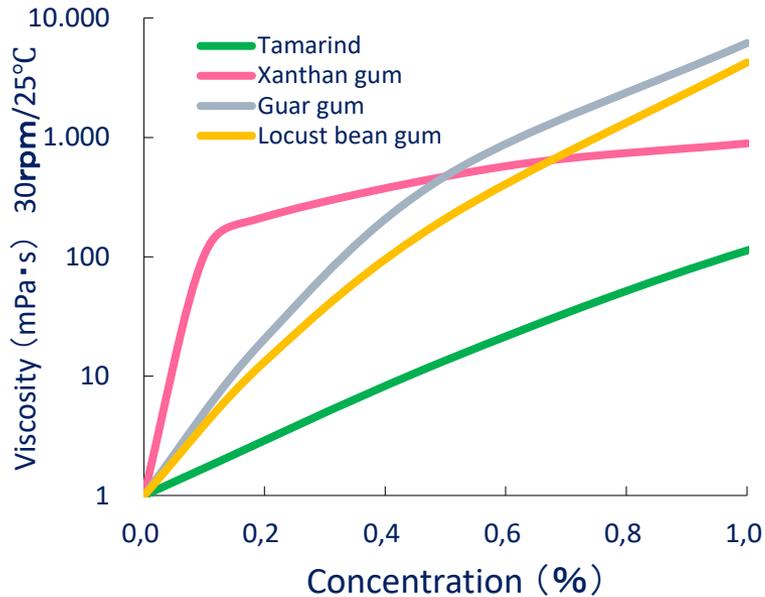

- Use TAMARIND If you have troubles in viscosity stability of your formulations

TAMARIND increases the viscosity or forms a gel when used in combination with sugars/polyols,.

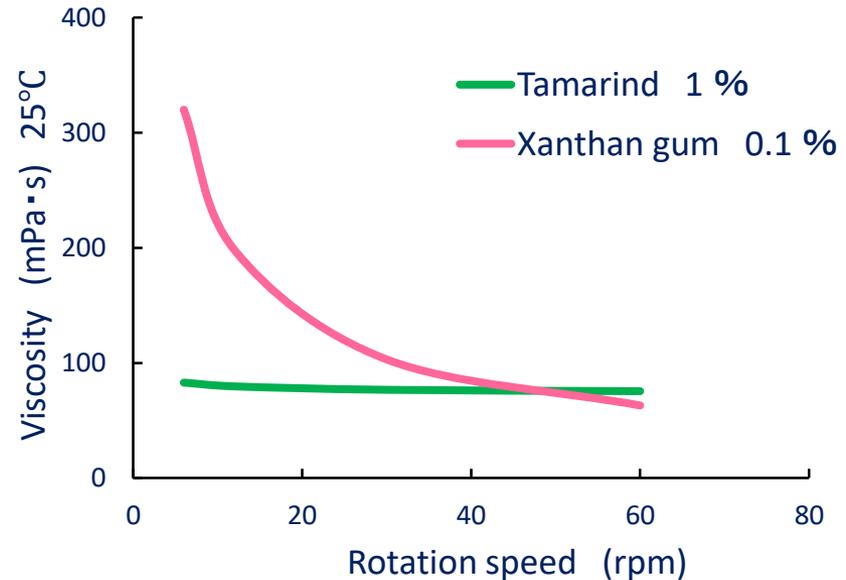

- Gelation occurs because of the specific 3D network of Gyloid molecules and sugars/polyols via hydrogen bonds which can hold water
- good compatibility with various surfactants as GLYLOID 6C is non-ionic.
- TAMARIND is compatible with surfactants regardless of anionic, cationic, amphoteric and non-ionic types. The mixture of TAMARIND and surfactants maintains a clear appearance and stable viscosity for a long period.

Viscosity and fluidity

< Viscosity curve >

< Fluidity >

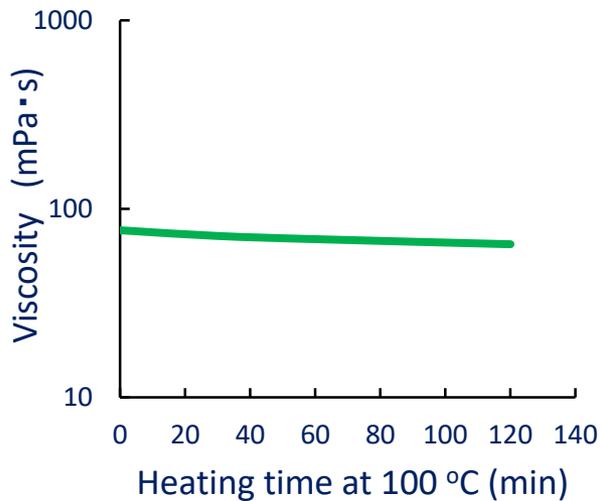

Tamarind shows moderate viscosity and Newtonian fluid

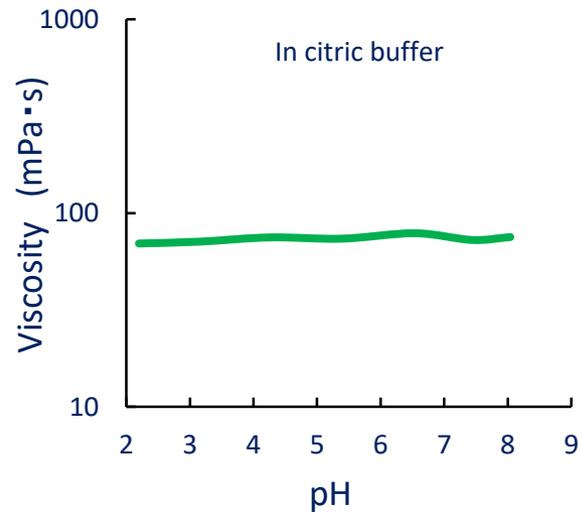

➤ Provides rich, but non-sticky texture

Powerful stability

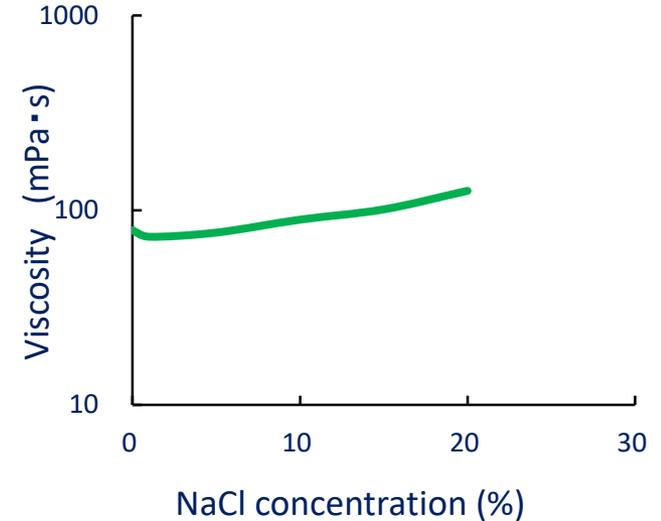

< Heat >

< pH >

< Salt >

1%Tamarind, 25°C, 30rpm

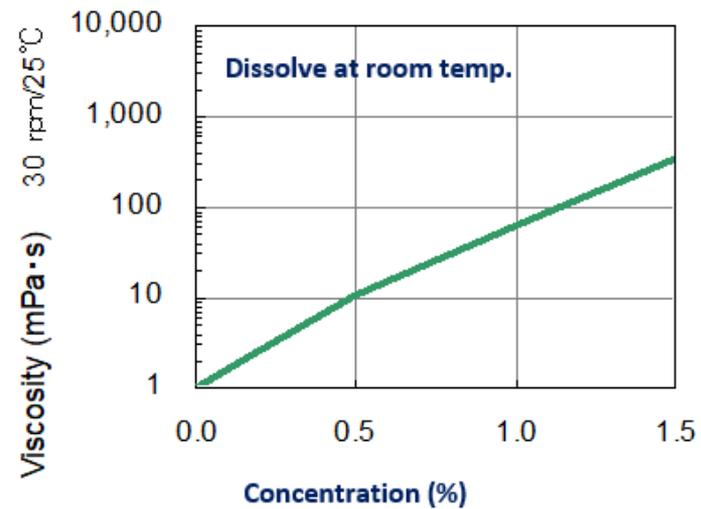

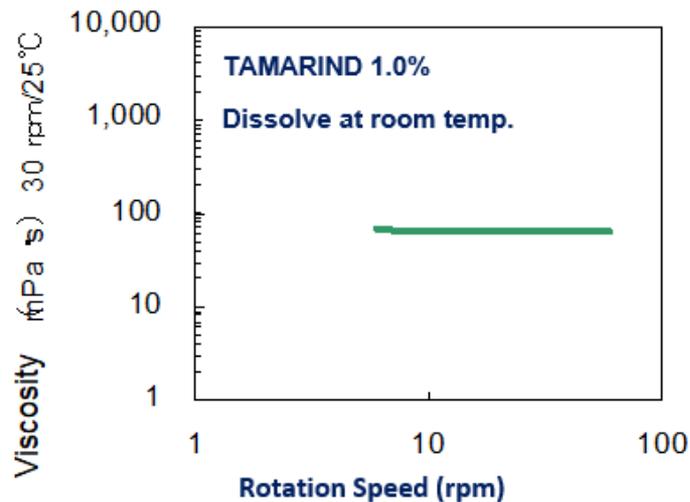

Tamarind keeps its viscosity in the presence of heat, acids and salts

- Contributes to improve stability of various formulations

Viscosity and fluidity

□ Viscosity

- TAMARIND solution exhibits Newtonian fluid

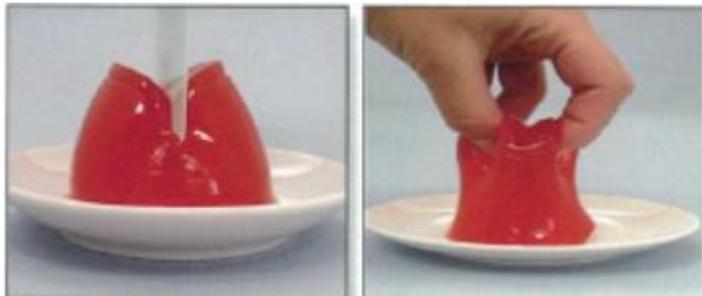

Powerful stability

- TAMARIND gel with ethanol is hard, brittle and opaque.
- TAMARIND gel with glycerin you can have different structure.
Hard but elastic, and has clear appearance.
- Sugar gel is similar to glycerin gel, but it takes overnight to completely form the gel.

Powerful stability

- When Tamarind is used in combination with sugar the solution becomes thicker synergistically as the sugar concentration increases and a gel is formed with a concentration between 40% and 65%. Tamarind also forms gels when used in combination with sucrose, erythritol, sorbitol, maltotriose, maltose and other sugars. These gels are highly elastic, exhibit very low level of syneresis and show high freeze-thaw resistance.
- Tamarind an acid-resistant polysaccharide forms gels under a wide range of pH regardless of the timing of addition of an acid.

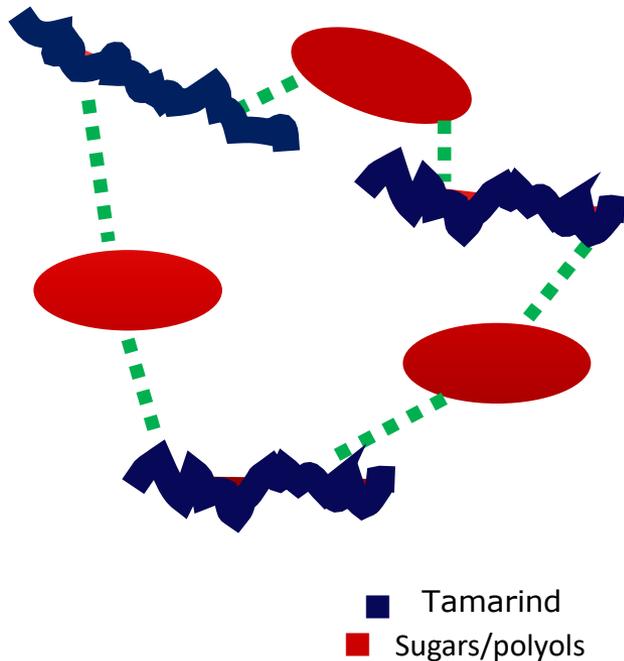

Powerful stability

- TAMARIND gel with ethanol is hard, brittle and opaque.
- TAMARIND gel with glycerin you can have different structure.
Hard but elastic, and has clear appearance.
- Sugar gel is similar to glycerin gel, but it takes overnight to completely form the gel.

Synergy effect with sugars and polyols

When used in combination with sugars/polyols, Tamarind increases the viscosity or forms a gel due to 3D network via hydrogen bonds.

Sol

- In combination with sugars, Tamarind forms thick solutions, whereby the thickness increases with higher concentration of sugar
- Gels are also formed when Tamarind is combined with sucrose, erythritol, sorbitol, maltotriose, maltose, and other sugars
- Above gels are highly elastic, exhibit very low level of syneresis, and show high freeze-thaw resistance

Ideal gel texture from different polyols

Different types of sugars/polyols result in different characteristics of gels with Tamarind in terms of time for gelling, texture etc. ...

Ingredients	Gelation		Properties of gel			
	Speed	Usage Level	Hardness	Elasticity	Syneresis	Transparency
Ethanol, etc. (Lower alcohol)	Quick	Gelation achieved with a small amount	Firm	Weak	Much	Opaque
BG, PEG, glycerin, etc. (Polyol)						
Sorbitol, trehalose, etc. (Sugar, alcohol, sugar)	Slow	Gelation not achieved unless a large amount is added	Soft	Strong	Little	Transparent

TAMARIND gel with different types of ingredients result in different characteristics.

- For example, gelation rate, gel texture and transparency will vary depending on the ingredients.
- In addition, needed amount to form a gel is different among polyols/sugars.

How to make tamarind seed gum gel with different polyols?

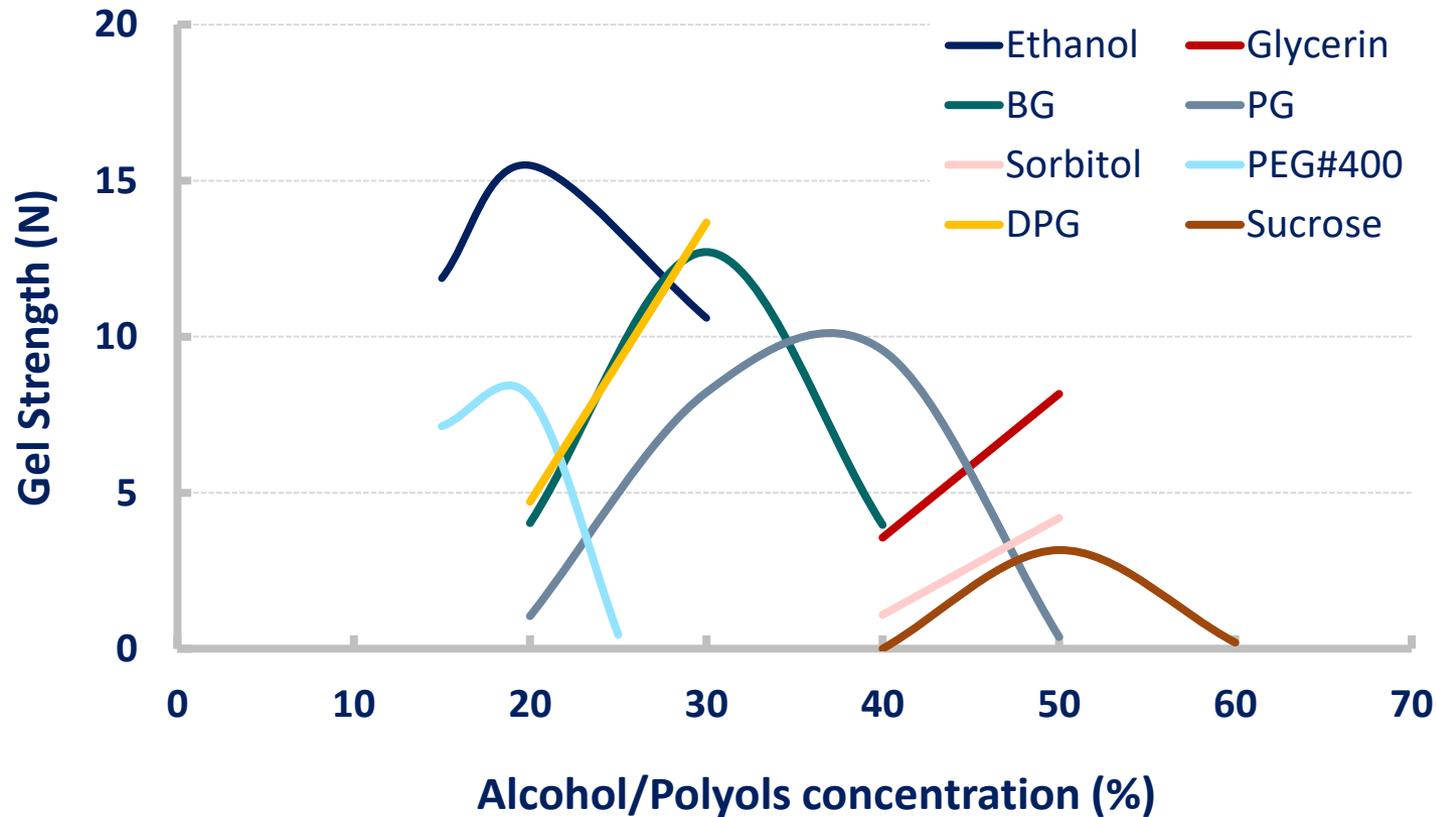

Ingredients	Gelation		Properties of gel			
	Speed	Usage Level	Hardness	Elasticity	Syneresis	Transparency
Ethanol, etc. (Lower alcohol)	Quick	Gelation achieved with a small amount	Firm	Weak	Much	Opaque
BG, PEG, glycerin, etc. (Polyol)	↑	↓	↑	↓	↑	↓
Sorbitol, trehalose, etc. (Sugar, alcohol, sugar)	Slow	Gelation not achieved unless a large amount is added	Soft	Strong	Little	Transparent

Standard Procedure

1. Disperse Tamarind seed gum into water while stirring and heat at 80°C for 10 minutes.
2. Add polyols and mix well until the mixture becomes consistent. Ethanol should be added at 70°C.
3. Pour the mixture into a container and cool to room temperature.

Gel strength vs Alcohol/Polyols concentration

1.0% Tamarind*

Compatibility with Surfactants

Surfactants		Concentration (%)				
		1	2	5	10	20
Anionic	SODIUM LAURYL SULFATE	—	—	—	○	○
	SODIUM LAURETH SULFATE	—	—	—	○	×
	SODIUM LAUROYL SARCOSINATE	—	—	—	○	△
	SODIUM COCOYL GLUTAMATE (Amino acid)	—	—	—	○	○
	SODIUM LAUROYL METHYLAMINOPROPIONATE (Amino acid)	—	—	○	○	—
Cationic	STEARTRIMONIUM CHLORIDE	—	—	—	○	○
	BENZALKONIUM CHLORIDE	—	—	—	○	○
Amphoteric	LAURYL BETAINE	—	—	—	○	○

	PEG-50 HYDROGENATED CASTOR OIL	○	○	—	—	—

○ : Compatible △ : Insoluble material occurs × : Incompatible: precipitation occurs — : Not evaluated

Condition TAMARIND (0.5%) with each concentration of surfactants

Evaluation Transparency (Visible test), Viscosity (30rpm/ 25°C)

* With higher amount of surfactants, the viscosity of TAMARIND increases and gelation or precipitation readily occurs.

Compatibility with surfactants

- Tamarind is highly compatible with various surfactants and can make them thick. The mixture of Tamarind and surfactants maintains a clear appearance and stable viscosity for a long period

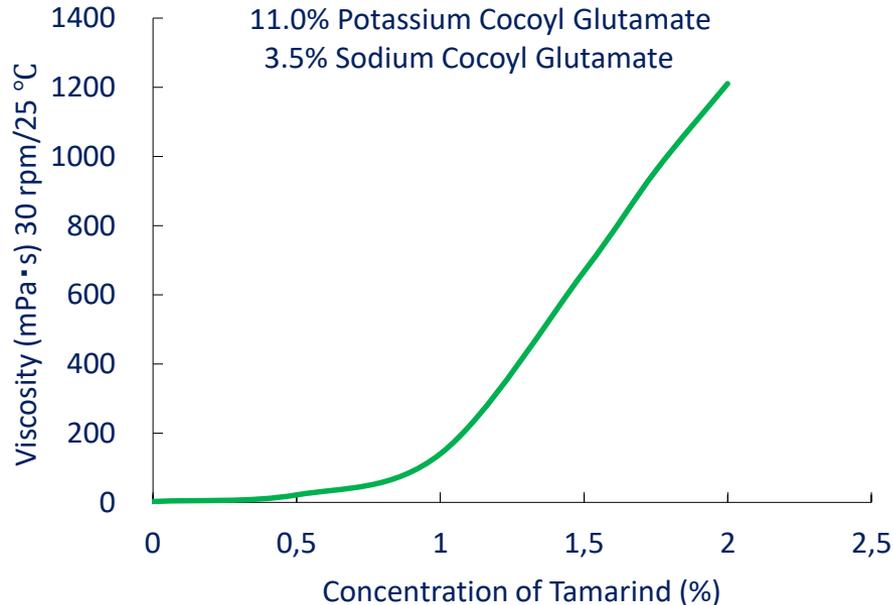

Type	Compatibility	Name of Surfactants
Anionic * Amino Acid	Good	SODIUM LAURYL SULFATE
		SODIUM LAURETH SULFATE
		SODIUM LAUROYL SARCOSINATE
		SODIUM COCOYL GLUTAMATE (Amino acid)
		SODIUM LAUROYL METHYLAMINOPROPIONATE (Amino acid)
Cationic	Good	STEARTRIMONIUM CHLORIDE
		BENZALKONIUM CHLORIDE
Amphoteric	Good	LAURYL BETAINE
Non-ionic	Good	PPG-8-CETETH-20
		PEG-50 HYDROGENATED CASTOR OIL

- Tamarind can add viscosity to amino acid –based surfactants which are usually difficult to be thickened

Amino-acid based surfactants can be thickened

Tamarind can add viscosity to amino acid-based surfactants, which are usually difficult to be thickened.

< Amino acid-based >

Ingredient	(%)
Tamarind	q.s.
Surfactant	50
BG	4
Methyl paraben	0.1
pH adjuster	q.s.
DI water	to 100

- ✓ Amino-acid based surfactants. It is sometimes difficult to be thickened by ionic polymers like carbopol.
- ✓ non-ionic TAMARIND can make it thick. As the graph shows, more than 1% TAMARIND can add viscosity efficiently.

Benefits of Tamarind in formulations

Category	Benefits of Tamarind	Use level (%)
Lotion	Rich and not stringy texture	0.05 – 0.5
Skin care gel	Rich and not stringy texture, to form gel in combination with polyols	0.1 – 2.0
Milk lotion, Cream	Better emulsion stability, rich and not stringy texture	0.1 – 2.0
Gel face mask	To form gel gradually in combination with polyols	1.0 – 4.0
Gel soap	To form gel in combination with polyols	1.0 – 4.0
Shampoo, Face wash	Excellent long-term stability, good compatibility with surfactants, to add suitable viscosity to shampoo, to improve foam firmness	0.1 – 2.0
Hair treatment	Rich and smooth texture, good clinginess to hairs	0.1 – 2.0

Weak acidic body shampoo

A little thick body shampoo having amino-acid based cleaning ingredients. Gentle on the skin, clear appearance.

Key: Good compatibility of Tamarind with amino-acid based surfactants

FEATURES

Plant-derived

Newtonian fluid

Good stability

Unique synergy with polyols

Compatible with surfactants

VALUES

- ❑ To provide natural perception
- ❑ To provide rich, smooth and non-sticky texture
- ❑ To contribute to stability against acids, salts and heating process
- ❑ To change rheological properties of formulations from sol to gel
- ❑ To allow to use various surfactants
- ❑ To thicken amino-acid based surfactants

Muji Face Soap

Company: Ryohin Keikaku

Market: Japan

Date Published: Nov 2019

Sub-Category: Face/Neck Care

Price: JPY390.00 / \$3.60 / €3.23

Pack Size: 30.000 g / 30.000 g
